Introducing... the Automatic Voice Announcer!

Transmit to your team even if you're occupied!

The 'Automatic Voice Announcer' is a system that can be used in a number of applications, where the operator may be busy or on the phone and unable to communicate over the radio. When the operator presses a button on the panel, their radio will transmit a message over their network, meaning that they can communicate with the team even if they're unable to speak.

A number of different applications!

This system is particularly useful for the taxi industry, as the base operator could be busy taking phone calls but would still be able to transmit commands or responses over the air without interruptions. In fact, the system is useful for any application where the transmission of recurring messages is required, such as security warnings, directions or commonly used commands, so it is useful within a number of different industries.

How the system works with the Mobile Radio

The Automatic Voice Announcer connects to a fixed SiteMaster Mobile Radio in your office, and a fist microphone can be connected to the panel so that you can still speak on the radio like you would normally. The system stores up to 3 different pre-recorded voice clips, which are transmitted over the radio by pressing their respective buttons on the panel. This lets you transmit recurring messages without the need to speak. It also features an On/Off switch, an "active" LED, and a volume control and speaker for you to hear back what's being played. The system stores the recordings and is connected to the customer's WiFi, so that we can change the recorded messages upon request. These custom messages can be recorded by you or by ourselves.
